# 1. What's the problem?

Analyzing and modelling complex social, organisational and technical systems presents us with a number of difficult methodological problems. Firstly, many of the factors involved are not meaningfully quantifiable, since they contain strong social, political and cognitive dimensions. Secondly, the uncertainties inherent in such problem complexes are in principle non-reducible, and often cannot be fully described or delineated. This includes both so-called *agonistic uncertainty* (conscious, self-reflective actions among competing actors) and *non-specified uncertainty* (for instance, uncertainties concerning what types of scientific and technological discoveries will be made in the future).

Complex policy and planning issues involving these types of uncertainties have been termed *wicked problems* or *social messes* (see the ten criteria for “Wicked Problems” at [www.swemorph.com/wp.html](http://www.swemorph.com/wp.html)). For these types of issues, quantitative methods, mathematical modelling and *traditional risk analysis* are relatively useless.

General Morphological Analysis (GMA) is a method for rigorously structuring and investigating the total set of relationships contained in multi-dimensional, non-quantifiable, problem complexes. Originally developed at the Swedish Defence Research Agency (FOI) by Dr. Tom Ritchey, it can be used for structuring complex policy and planning issues; developing scenario and strategy laboratories; analysing organisational and stakeholder structures; and creating business logic models.

GMA has been used for 15 years in more than 100 projects for:

- Developing virtual scenario and strategy laboratories
- Policy and stakeholder analysis
- Organizational development
- Market analysis and product design
- Technological foresight
- Crisis Management and Disaster Reduction Strategies

Clients include (see full client list at [www.swemorph.com](http://www.swemorph.com)):

- Defence Science and Technology Laboratory (Dstl), England
- Organisation for Applied Scientific Research (TNO), Netherlands
- Center for Science, Policy and Outcomes (CSPO), Washington DC
- Center for Science and Industry Research (CSIR), Republic of South Africa
- Earthquake Disaster Mitigation Research Center (EDM), Kobe, Japan
- The Arlington Institute (TAI), Washington D.C.
- National Security Coordination Secretariat (NSCS), Singapore
- European Defence Agency (EDA), Brussels
- London City University, City Research and Enterprise Unit (CREU)
- EU 7th Framework Program (Social and cultural modelling)

## 2. How is GMA utilised?

**GMA's** principal strength is in structuring and analysing the internal relationships in complex, multi-stakeholder societal and organisational problem areas – often referred to as *wicked problems*. This can be done as an *initial phase for an entire project*, or as a *one-off problem structuring session* for an organisation or organisational unit. For more information on this type of problem structuring process, see:

Ritchey, T.: "Problem Structuring using Computer-Aided Morphological Analysis". *Journal of the Operational Research Society* (2006) 57, 792-801. The article can be downloaded at: <http://www.swemorph.com/pdf/psm-gma.pdf>

**There are *three main roles* that GMA can play in projects:**

- 1) At the beginning of a project, to bring together the relevant competencies in the project group in order to create a *conceptual model* of the project's *total problem space*, and to map out all of the interconnections or relations between the different *parameters* of this space. This serves to carefully define the problem complex, to "bound" the problem area and to get all participating organisations "on the same page", i.e. to have a common terminology and common conceptual framework for the problem complex. This common framework can be returned to periodically as a reference to what one is doing, and can be up-dated if and when new discoveries are made about the problem area. It thus serves as a form of "audit trail" for the project as a whole.
- 2) During the project, to facilitate any non-quantified modelling that needs to be done. This includes scenario and strategy models, organisational structure/change models, and stakeholder-position models. Especially during longer (2-5 year) projects, it is often the case that a particular work-package needs its own initial "conceptual modelling" phase, as in point 1 (above).
- 3) At the end of the project, to create a number of *non-quantified inference models* representing those aspects of the *results* of the project, which cannot be (meaningfully) rendered as quantitative models. These morphological models are computer-based, and the recipients of the project's results receive software in order to run them.
- 4) For the dissemination phase, to demonstrate the results of the project in a graphical, interactive form. This type of demonstration has shown itself to be greatly appreciated by stakeholders, domain experts and potential end-users.

### 3. Benefits of employing GMA

**Whether for creating scenario/strategy modelling laboratories, policy analysis or any form of complex problem structuring, GMA offers the following benefits.**

- GMA creates an actual **modelling laboratory** which represents the total problem space, and which can generate any number of alternative solutions in the form of scenarios, strategies or organizational structures.
- GMA models define an actual (internally specified) **parameter space** in which single or multiple drivers can be assigned as inputs, alternative outputs obtained, and inferences ('what-if' assertions) made.
- GMA assures the **internal consistency** of all possible solutions (scenarios, strategies, etc.) through the process of Cross-Consistency Assessment (CCA).
- The CCA process creates "**inference by exclusion**" – by excluding everything that is impossible, and including everything else which is possible, surprising events or solutions ("wild cards") are **counted in**, rather than **counted out**.
- The CCA also explicitly enables **boundary research**, and thus helps a project group bound its problem area from the outset.
- The GMA process provides **traceability and transparency** – i.e. it leaves an "audit trail" showing what assumptions and decisions were made in defining the problem space and synthesising the outcome space. This "audit trail" is literally built into the method in the form of the internal consistency checks done by the CCA.
- GMA functions through **group interaction and iteration**, rather than back office constructions. This provides a forum for collective creativity; it engenders out-of-the-box thinking; and it creates "smart teams".
- GMA facilitates a **graphical (visual) representation** of the problem area for the systematic, group exploration of a solution space. This graphic presentation is computer-based, and one of the **deliverables** – beside the chosen scenarios as such – is the complete modelling laboratory with software to run it.
- GMA concentrates on **possibility** rather than **probability** (for instance, ascribing probabilities to futures projections ranging more than 3-5 years in the future is an act of self-delusion).
- GMA scenario models are **easy to update**. These are not "one-shot" solutions, but are **living models** which can be periodically updated and restructured without having to start all over again. This is the case even if a completely new group is employed in the update procedure!
- All GMA models are **formally compatible** with one another. A model from one sub-area in a study can be compared or merged with that of other areas within the study; and several sub-area models can be formed into a comprehensive model representing the total problem area.

## 4. GMA Workshop Process Description

1. **The establishment of contact with the “Principal client contact”.** This contact person is usually the buyer or initiator of the GMA workshops. In any event, she/he has a vested interest in the success of the workshops for the client’s decision support needs.
2. **Give one-two hour presentation of GMA as a scenario & strategy modelling technique,** preferably to a group of people supporting the principle contact person as well as potential workshop participants.
3. **Meeting with the *principal client contact*** to discuss the number of planned workshop days, dates, venue, “focus question(s)” and (crucially) group composition. The discussions must concern *at least* the following:
  - A preliminary, generic “focus question” for each modelling context is to be formulated, in the following form:

“What are the most important factors (parameters/variables) concerning ... [the client’s problem area]... and how are these factors related to each other (how are they *entangled*).”
  - The venue should be a meeting room for at least 15-20 people, i.e. at least twice as many as the number of participants in a GMA workshop (6-7). GMA workshops require room for people to move around in.
  - No “observers” are allowed to be present during the group GMA working sessions.
  - GMA workshops are carried out in sequences of 2-day sessions. If several workshops are to be carried, these must have an agreed time-lap between them (days or weeks) in order that the process is allowed to mature.
4. **Group selection and composition is carried out collaboratively by the principal facilitator and the client.** (See separate document on “*Guidelines for selecting GMA workshop participants*”.)
5. **Distribution of focus question:** A week before the first workshop is to take place, the “focus question”, along with a suitable article on GMA, is sent out to the members of the SMS working group. They are encouraged to think about the focus question and formulate what they think are the most important factors (variables) in the problem area. They are also told that they need not otherwise prepare for the workshops.
6. **Beginning the first workshop day:** GMA as a method is presented in detail to the SMS group with examples/case studies close (but not too close) to the current problem area. The preliminary focus question is brought up and discussed, and the group is asked if they are satisfied with it, or if they want to adjust it.

7. **Analysis phase – Development of the initial *Morphological Field*:** Using only a white board (no computer at first), the facilitator works with the group to identify the most important dimensions/parameters/variables in the problem complex. As each parameter comes up on the white board, one or two examples of its value range (conditions) are given, in order to help clarify the meaning of the parameter.

*This first phase of the MA process is the most important one, and often the most demanding one, since there can be uncertainty – or complete disparity – about what the most important parameters are, and how they are to be expressed. The process of “giving form/shaping” the initial morphological field is iterative and can take a full workshop day or more, depending on the size and nature of the problem complex. This initial field represents the total “problem space” and can contain hundreds of thousands of configurations, i.e. formal solutions. (This is the most demanding part of the GMA process for the facilitator. It can literally take years of experience to learn to be comfortable with this process.)*

8. **Synthesis phase – Cross-Consistency Assessment (CCA):** The next step in the analysis-synthesis process is to reduce the total set of (formally) possible configurations in a “problem space” to a smaller set of internally consistent configurations representing a “solution space”. If the morphological field contains less than c. 100,000 possible scenario configurations, this process can be carried out within the 2-day workshop process.

If the morphological field contains more than c. 100,000 configurations, the CCA process may need more time, or it can be done indirectly, by defining a number of configurations (scenarios, strategies, systems or structures) in the morphological field, and checking each of these for internal consistency.

9. **Examine the *structure* and *coherence* of the morphological model.** When a prototype morphological model is completed and compiled, it must be examined carefully to establish its nature and properties – how it coheres and behaves. There are six steps to this examination (the details of which are available to clients and GMA workshop partners):

- Model coverage/model linkage
- Model coherence and Boolean analysis
- Parameter Activity Check (PAC)
- Identification of multiple boundary values
- Identification of driver and multi-driver structure
- Time-line analysis

10. **Define ranges of scenarios, strategies or other configurations.** Any number of configurations representing scenarios, strategies, structures or stakeholder positions can be generated and defined within the model and related to one another. The model allows the user to define configurations using initial inputs, desired outputs, and with clustered variations.

The models belong to the client, who is supplied with dedicated software in order to run and maintain them.

Six months “service” of the model is included in the workshop package.

The iterative process of developing a morphological model is:

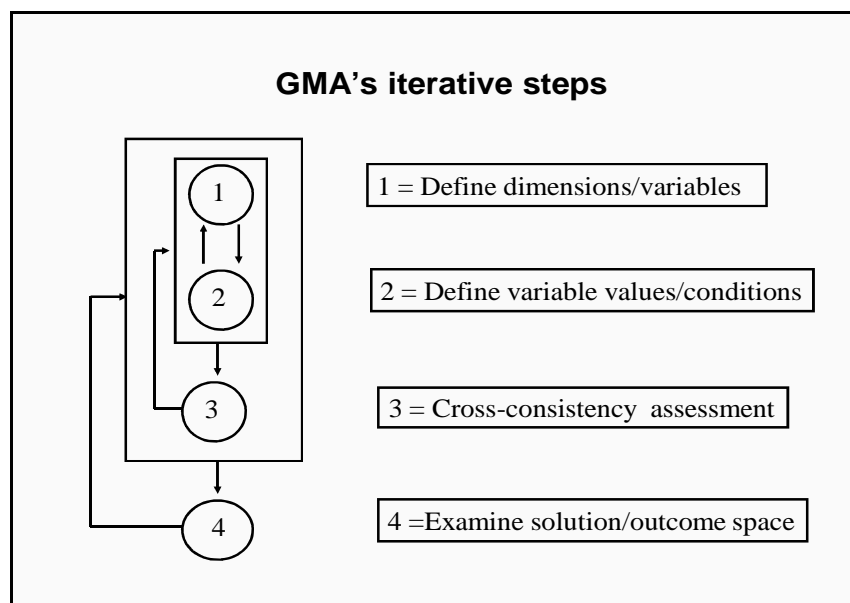

Figure 1: GMA's iterative steps

## 5. Guidelines for selecting GMA workshop participants

1. The ideal group size for morphological modelling is 6-7 subject matter specialist (SMS)/stakeholder participants. *No “observers” are allowed.* The group work is facilitated by 1-2 experienced GMA facilitators.
2. In choosing participants, identify the principal, general areas of competence that are needed for the mapping of the problem space. Avoid duplicate competencies and avoid competencies that are too specific or specialised (these can be brought in if and when needed).
3. All participants should be motivated. People who are “ordered” to participate, but do not really want to be there, will not contribute in an effective way.
4. Besides being experienced in their respective areas of competence, workshop participants should be intellectually curious and enjoy working with new methods, thinking out of the box and exploring new ideas *collaboratively*.
5. If possible, participants should come from different (relevant) areas within the organisation, or from different organisations, which *represent different aspects of the problem area or different stakeholder positions.* (One of the main principles of GMA facilitated workshops is that *more effective results can be achieved when problems are framed, and solutions created, understood and accepted by people who are actually impacted by the problem area – i.e. stakeholders.*)
6. If the right competencies can be found, one should also strive for a good mix of gender and age.
7. Avoid people who represent high, strong leadership positions *if their presence might inhibit other participants’ free thinking and free discussion.* No “big bosses”.
8. Avoid participants who think that they already know the answers and solutions. In the beginning, we are *not attempting to “find solutions”,* but to comprehensively *define the total problem space of all possible solutions.*
9. All workshop participants are expected to show respect for and support the integrity of the working group.

## 6. Facilitation Guidelines and Ground Rules

(As presented to the workshop group)

1. The facilitator is responsible for competently and correctly facilitating the *method and the process* and will not allow conditions to be imposed that would undermine the correct application of the method or the quality of the work.
2. The facilitator is not (and should not be) a subject matter specialist (SMS) or a stakeholder in the area relating to the workshop, or the results of the workshop.
3. The facilitator does not intrude upon the content or the *subject matter* of the workshop. The facilitator may ask questions of clarification concerning the concepts being used in the modelling process.
4. The subject matter specialists (SMS) *are responsible* for the content and subject matter relating to the workshop.
5. The facilitator will endeavour to bring all of the participants into the modelling process and discussions, and strive to bring all relevant issues “to the table”.
6. There is no *voting* for allowing concepts to be discussed or brought into the model. Hidden agendas are discouraged and the censorship of ideas is disallowed. There are minority rights.
7. Rules of Engagement (RoE) are discussed at the beginning of the workshop. A decision will be made on how to treat the process, the models and all other information generated by the workshop. Is this:
  - a. Open information?
  - b. Not secret, but not for distribution?
  - c. Treated with so-called Chatham house rules?
  - d. Secret?

## 7. Biography & Contact Details

Dr. Tom Ritchey  
Ritchey Consulting LLC  
Swedish Morphological Society

Dr. Tom Ritchey is a former Research Director at the Institution for Technology Foresight and Assessment, at the Swedish National Defence Research Agency (FOI) in Stockholm. He is a methodologist and facilitator who works primarily with non-quantified decision support modelling -- especially with General Morphological Analysis (GMA), Bayesian Networks (BN) and Multi-Criteria Decision support (e.g. AHP)

He received his doctorate in Social Anthropology at Uppsala University, where he worked on theories and models of social evolution. His academic background also includes mathematics, the history of philosophy and computer science. He has been a senior lecturer at the University of Lund (Sweden) and at Copenhagen University, and has been a Research Fellow at the Department of Urban and Regional Studies at Sussex University in England.

Employed by the Swedish Defence Research Agency (FOI) from 1983 to 2006, he worked with strategic decision support modelling in the areas of crisis management/ civil preparedness, risk mitigation, scenario development and strategy management. In 1995-96 he developed *computer aided morphological analysis* as a general method for non-quantified modelling. Since then, he has carried out more than 100 projects employing this method for structuring complex policy and planning issues, developing scenario and strategy laboratories, and analysing organisational and stakeholder structures. He has published internationally on its theory and applications. His latest book, "Wicked Problems/Social Messes", was published by Springer in 2011. He is the founder of the Swedish Morphological Society, Director of Ritchey Consulting LLC and a founding partner of the U.K. based Strategy Foresight Partnership.
